

Data Protection Impact Assessment

Data Protection Impact Assessment (DPIA)

- DPIA process is to support organisations in considering and determining the risks associated with data protection.
- DPIA must consider:
 - context, scope, nature and purpose of data processing
 - risks to individuals
 - mitigation measures for those risks
 - assess compliance, proportionality and necessity of processing.

Data Protection Impact Assessment (DPIA)

Automated decision-making

- DPIA is required if you meet the requirements of Article 22.
- DPIA can also be used to determine if processing does come under Article 22.
- Determine the risks of the profiling and automated decision-making process **and** the mitigation to those risks.

Data Protection Impact Assessment (DPIA)

Automated decision-making

- Publish the DPIA, but this is not required.
- If you identify high risks that you can not mitigate then the DPIA must be submitted to the ICO (in the UK context).
- The ICO can advise of the outcome, including prohibiting the intended processing.
